  Message points for patients and families

This information was developed collaboratively across Wellforce to serve as a general guide to support physician practices as they work to re-introduce services in our new COVID-19 era. It has been reviewed to reflect information specific to Tufts Medical Center Community Care, however if you come across generalities that raise questions, please contact Dr. Doug Schulte or Lori Barrett for clarification or more information.
Introduction

In just two months, our world has changed. From COVID-19’s earliest onset, leadership, through Incident Command, made it a priority to support employees, staff and network practices and promote safety. In the spirit of partnership and collaboration that have defined our work during the last several weeks we remain focused on clinical and operational support, safety and well-being.

- **Clinical support** – We continue to monitor, aggregate and disseminate COVID-19 clinical guidance to our providers and staff and share relative information that supports clinical practices.

- **Operational support** – We are focused on supporting our providers through a prolonged period of COVID-19 recovery and expected recurrences by helping our practices:
  - Secure reliable access to PPE and COVID-19 testing
  - Redesign office workflows and protocols to limit COVID-19 exposure such as prescreening guidelines, worksite adaptations to support physical distancing and enhanced office disinfection
  - Segment patients based on risk and patient preference and implement triage protocols to route them to the right channel to limit risk exposure and optimize practice capacity
  - Proactively communicate with patients about how they will be kept safe and the importance of chronic care continuity
  - Execute a pipeline conversion plan to reschedule appointments/procedures that have been postponed/cancelled
  - Fully integrate the permanent use of telehealth into patient care delivery and reimbursement
  - Adjust practice staffing models based on volumes of in-person care and the need to manage patient flow differently
  - Support staff emotional well-being, paying extra attention for signs of exhaustion, depression, stress and other similar issues and putting mitigation strategies in place
  - Introduce tracking systems to meet advance payment and loan provisions
  - Develop contingency plans for how to navigate upcoming COVID-19 surges (rapid-cycle relapse/recovery)

While we may not have answers about COVID-19’s scope, duration and relapse cycles that will inevitably occur; we are committed to taking actions that sustain and support thriving provider practices as summarized above.

All of us deeply admire all that our providers continue to do for our patients and communities. Your tireless dedication does not go unnoticed – and is truly appreciated.
Quick Start Guide

Here are some recommendations to help you begin planning to safely and effectively reactivate your medical practice while COVID-19 remains prevalent. The recommendations have been developed in accordance with the Massachusetts Department of Public Health Guidance Reopen Approach for Health Care Providers (Providers that are Not Acute Care Hospitals). Appendix A. If you have questions please contact Lori Barrett at Lbarrett@melrosewakefield.org.

Infection Control
- Educate yourself and your staff about infection control
- Set your practice’s infection control policies and procedures
- Secure reliable access to necessary materials (e.g., Personal Protective Equipment [PPE], cleaning/disinfection materials)

Office Space Reconfiguration and Workflows
- Pre-visit COVID-19 screening questions, with confirmation call
- Office signage/Patient flow
- Waiting rooms and staff gathering areas: Chair spacing/masks, tissues, sanitizer
- Contactless registration and payment

Schedules
- Segment the day: Infectious or not? Telehealth vs in-person visits?
- Build in extra time for PPE, room cleaning/disinfection, to avoid patients meeting in the halls
- Which patients need to be seen first? How to convert scheduled in-person visits to telehealth?

Telehealth
- Think about the balance between telePHONE (audio only) vs teleHEALTH (audio/video) visits
- Use telehealth for as wide a variety of use cases as possible
- Utilize your support staff optimally for telehealth support
- Assure you are coding and billing optimally for telehealth visits
Quick Start Guide (continued)

Reassuring Staff, Patients, and Families
- Review talking points related to safety and care of patients Appendix D
- Proactively communicate to your patients and staff: “We’re making it safe for you”

Human Resources Considerations
- Focus on supporting your colleagues through this difficult time
- Introduce daily symptom screening
- Follow criteria for exclusion from work
- Initiate cross-training for essential skills/cross-coverage with other practices
Infection Control

Personal Protective Equipment

*Appendix B, Section A3*

Providers and staff must follow these guidelines for effective PPE use in the ambulatory setting:

- **Universal enhanced droplet precautions** (with all patient clinical contacts)
  - Patients should not be seen unless there are sufficient masks and gloves for all staff who need to approach patients within 6 feet (*Appendix B, Section B1*)
  - Eye protection is recommended for clinical staff who need to approach patients within 6 feet.
  - Gowns are not necessary for most ambulatory encounters

- **Importance of different PPE items**
  - **Mask**: Simple medical mask (e.g., surgical mask, procedure mask) should be worn in any clinical encounter involving an approach within 6 feet of a patient. Click [here](#) for guidance about how to use a mask.
    - Please note: A N95* or equivalent mask is NOT needed in the office setting, except for aerosol-generating procedures (*Appendix C*), which should generally not occur in the primary care office setting while COVID-19 is a concern. (Nebulizer treatment is the only common aerosol-generating procedure in an office setting.) (*Appendix B, Section B1b*)
  - **Gloves** (exam gloves; sterile gloves if clinically necessary)
    - Hand hygiene must be performed before and after glove use
  - **Eye protection** Anything that covers the eyes, prevents droplets from getting in, and doesn’t compromise vision is acceptable
    - Goggles which seal to the face. The use of safety or ski goggles is acceptable if you can see through them appropriately and if they can be cleaned and disinfected.
    - Face shield—disposable or cleanable/reusable—offers maximal protection
    - Eye protection must be worn (along with an N95 mask) for aerosol-generating procedures

* N95 confers no additional protection without appropriate fit testing (done once, to ensure a given brand/size of N95 mask CAN fit that wearer correctly, training to ensure wearer knows how to put it on and wear it correctly) and fit checking (each use, to make sure there is a tight seal).
Infection Control (continued)

- **Gown**
  - Not necessary for most ambulatory uses; should be used if significant splash or splatter is expected (irrigation; incision of abscess; percutaneous sampling of body fluids)
  - Gowns should be worn for one patient only and then removed for disposal or laundry
  - Single-use gowns should not be cleaned or sanitized for reuse

- **Extended use of masks and eye protection with multiple patients** *(Appendix C)*

- **Masking patients**
  - Patients should be masked prior to (or upon) office entry either with a simple medical mask, or with their own fabric mask or mouth/nose covering if supplies of medical masks are limited

- **Non-medical grade PPE**
  - Homemade PPE other than a fabric mask should not be used for patient clinical encounters

- **PPE for non-patient-facing staff**
  - When the supply of medical masks is limited, homemade masks may be used for roles without face-to-face patient contact <6 feet, to reduce transmission between staff when social distancing (>6 feet) is not possible
    - Social distancing is always preferred when possible *(Appendix B, Section B5)*

- **PPE donning and doffing** *(Appendix B)*

---

**DON**

- Gown
- Mask
- Faceshield
- Gloves

**DOFF**

- Gloves
- Faceshield
- Gown
- Mask
Infection Control (continued)

Cleaning and disinfection

*Appendix B, Section D5*

Office cleaning and disinfection protocols

- Visible soiling should be cleaned first before disinfection as dirt and organic matter will interfere with the disinfection. Any disinfectant has a required contact time or dwell time for the surface to remain wet with the disinfectant solution before wiping up. Disinfectants should contain any one of the following active ingredients:

<table>
<thead>
<tr>
<th>Ingredient</th>
<th>Dwell time</th>
</tr>
</thead>
<tbody>
<tr>
<td>Benzalkonium (e.g. Lysol)</td>
<td>3 min</td>
</tr>
<tr>
<td>70% alcohol (isopropanol or ethanol)</td>
<td>30 sec</td>
</tr>
<tr>
<td>Hydrogen peroxide (standard 3%, undiluted)</td>
<td>1 min</td>
</tr>
<tr>
<td>Chlorine bleach (Sodium hypochlorite, diluted 1:50)</td>
<td>1 min</td>
</tr>
<tr>
<td>Any other disinfectant EPA-approved to inactivate the coronavirus</td>
<td></td>
</tr>
</tbody>
</table>

- High-touch surfaces in the exam room or in any procedure room should be disinfected after every patient. These include the exam table, chair, doorknobs, light switch, faucets, and anything else the patient likely touched during the visit. These surfaces should also be cleaned with a standard surface cleaner whenever visibly soiled and at the end of the day, along with other high-touch surfaces like touch screens and keyboards. High-touch surfaces in waiting room, staff areas, and any common areas should be disinfected twice a day. Floors should be cleaned at the end of every day with usual cleansing agents.

Other supplies

- Plastic keyboard covers may be placed on computers to allow cleaning and disinfection. Inexpensive plastic sheets may be purchased that conform to standard computer keyboard layouts. The plastic aids keyboard disinfection because keyboards themselves generally may not be treated with liquids.
Infection Control (continued)

Provider and Staff Health

- Health assessment – Providers and staff should be required every day they arrive at the office to attest that they have no symptoms suggestive of COVID-19 (e.g., fever, chills, cough, shortness of breath or difficulty breathing, sore throat, muscle aches, vomiting or diarrhea, new loss of taste or smell) *(Appendix B, Section B3)*

OR

- If they do have symptoms consistent with COVID-19, they can be tested in the same fashion as patients if tests are available – either in the office or via their own health care provider,
  - If positive, they can either be:
    - Retested after symptom resolution until they meet the test-based return to work criteria,
    - OR follow the symptom-based criteria
  - If negative or not tested, they can follow the symptom-based criteria for return to work

Either way, staff may not return to work until they are cleared according to the CDC/DPH criteria.

- Tufts Medical Center Community Care employed staff will need to be cleared by MelroseWakefield Healthcare Occupational Health.

Currently, there are no recommendations for COVID-19 testing of asymptomatic staff.

If for some reason an asymptomatic staff member is tested, they may follow CDC/DPH criteria for clearance as well.

- Infection Control Education for Staff – Patient confidence depends on consistent application of infection control procedures, communication and staff readiness to answer questions and explain procedures. Staff must be educated on rationale for infection control and its practical application.
Infection Control (continued)

Miscellaneous

- Shared Food – No shared food should be allowed in non-patient care areas (e.g., candy bowl – even wrapped candy can be an infection vector). As usual, no food should be allowed in patient care areas.

- Consider not wearing dangling items such as neckties and necklaces as they may transfer organisms from one patient to another.

- Direct patient care staff to be “bare below the elbows” – short sleeves, no watch or jewelry – to facilitate good hand hygiene.

- Staff members within non-patient care areas should maintain a greater than 6-foot distance between them whenever possible. When it is not possible, both staff members should be masked. *(Appendix B, Section B5)*

- The number of health care personnel within a room while care is being rendered should be the minimum needed for that care, in order to reduce potential exposures to COVID-19 *(Appendix B, Section B2)*
Office Space Reconfiguration and Workflows

Office Space Reconfiguration
Design/re-design office space to maximize physical distancing between patients and office staff.

Seating Area Guidance
- Allow for at least one wheelchair location.
- Limit the number of seats in waiting area to ensure minimum of 6 feet distance in every direction. Remove extra chairs, and store elsewhere if possible. Turn chairs around to face the wall if removal is not possible.
- Place Infection Control Stations containing tissues, masks, and hand sanitizer as individuals enter/approach the waiting rooms and throughout waiting rooms for easy access.
- Eliminate high-touch items in waiting areas and countertops. All loose materials (literature, business cards, magazines, toys, etc.) should be removed as they can be vectors of infection. Such materials are not needed as patients should no longer spend substantial time in waiting areas.

Reception Area
- Plexiglas should be used if there is not 6-foot space between staff and patients.
- Place markings on floor as a guide for patients to stand back from desks or staff.

Check-in/Check-out process redesign
- Complete contactless check-in and check-out over the phone (or online) to minimize contact between patients and office staff. Include registration, filling out forms, and payment.

Exam rooms
- Keep relevant items in exam room when possible, so patient doesn’t need to leave (e.g., scale).

Staff Areas
- Set-up conference rooms, break rooms and/or kitchen areas for safe social-distancing layout. Make sure sanitizer, tissues, masks and disinfectant wipes are all handy within these areas.
- Remove extra chairs to support social distancing (similar to waiting room guidance).
- No shared food should be allowed (e.g., candy bowl – even wrapped candy can be an infection vector).
Office Space Reconfiguration and Workflows (continued)

Corridors and entryways
- If available, consider separate entrances for sick and well patients or for patient entrance and exit.
- If possible, create “one way” paths through hallways (with suitable signage) to minimize exposures.

Directional and safety signage
Prominently display directional and safety signs in the following locations:
- All entrances/exits and hallways (to guide movement in one direction through office if possible)
- Waiting rooms
- Elevators
- Floors to maintain social distancing
- Place signage throughout the office for patients and staff with instructions on wearing masks, one-way flow through hallways if feasible, etc.
- Signs should also remind of respiratory hygiene, e.g. “Please keep your mouth and nose covered at all times”; “If you need a mask, ask any of our staff”; “Cover your cough”, and indicate the location of infection control stations with masks, sanitizer and tissues.
- Encourage staff to use the stairs when possible while moving between floors to free up the space in elevators for patients.

CDC website has printable flyers and posters available to print. See https://www.cdc.gov/coronavirus/2019-nCoV/index.html

Scheduling and Patient Prioritization

Modify patient schedule to incorporate telehealth visits, assure appropriate physical distancing between patients, and maximize time available to appropriately clean exam rooms and equipment. Proactively determine which patients require in-person appointments and which patients may be effectively managed with telehealth.
Office Space Reconfiguration and Workflows (continued)

Staff scheduling

- If multiple providers are in a practice, consider establishing a staffing schedule where some providers remain at home to conduct telehealth visits and others are in the office for in-person consults. This will minimize the numbers of providers and staff in the office at once.

- Consider expanding office hours to allow for minimum number of staff, providers, and patients in office space at any time.

Patient scheduling

- Consider conducting telehealth well-patient visits in two parts:
  - First, with telehealth visit for all parts of visit that can be successfully completed virtually and then second, schedule an in-person visit for anything requiring the patient’s physical presence (e.g., brief directed exam, immunizations, labs, etc.). This will minimize the amount of time patients are in the office.
  - Consider whether the in-person portion could be done by a single person even if not the normal workflow to reduce potential exposures and PPE use.

- Consider conducting immunization clinics during normal appointment hours, interspersed with other patients when designated physical space is available, or outside normal hours in a drive-by format where patients do not exit their cars, to reduce exposure.
  - Plan flu immunization clinics now, including ordering ample doses of vaccine. High vaccine uptake should be expected this year.
    - Consider all formulations that may be needed (including intranasal for needle-phobic and some pediatric patients, high-dose for elders, and egg-free formulations for patients with severe current egg allergy.)
Office Space Reconfiguration and Workflows (continued)

Patient scheduling (continued)

- Post signage outside the door notifying patients they must be screened over the phone and scheduled for telehealth or in-person visits as appropriate.
  - Be prepared to manage patients who do show up despite these guidelines
- Lengthen appointments to allow time for room cleaning and disinfection, PPE changes etc.
- Schedule sick appointments and anyone with active COVID-19-compatible symptoms, regardless of reason for visit, during one half of the day, and physicals and follow up appointments during the other half of the day, to reduce exposure of well patients.

Patient Prioritization

- Assign staff to review any patient appointments that were canceled/postponed in March/April
  - Clinician or nurse should review those appointments to designate clinical priorities
  - Conduct outreach to reschedule canceled or postponed appointments as either telehealth or in-person appointment, as appropriate
- Review high-risk patient lists provided by Hallmark Health PHO and outreach to patients to schedule telehealth visits.
- Clinical priorities beyond active issues
  - High-risk deferred care based on acuity or risk profile (e.g., patients whose workup for cancer-suspect findings were interrupted by the pandemic)
  - Preventive care
    - Routine pediatric care and immunizations
    - Screenings for high risk patients (e.g. breast cancer and colon cancer screening)
  - High risk or high acuity BH/psychosocial issues, SUD/MAT, evaluation for suspected child abuse or domestic violence
  - Evaluation and diagnostic workup of high-risk, high urgency findings (blood in the stool, breast lump, concerning skin lesions)
  - Procedures that if deferred might lead to serious potentially avoidable outcomes (malignant skin lesions, tooth extractions for abscess)
  - Follow-up for chronic diseases
  - Placement of long-acting reversible contraception
  - Immunizations
- Patients who have difficulty with technology (and thus for whom telehealth visits may not be effective) should be prioritized for in-person visits.
Office Space Reconfiguration and Workflows (continued)

Non-patient visitors and patient companions
- People who accompany patients should be asked to not enter the office if possible. They should remain with patients only if the patient needs them during the visit.
- Limit office visits by non-patients (e.g., supplies, vendors, salespeople). Clearly post signs for non-patients with instructions for how to schedule phone or video conferences. Designate times outside of normal patient-care hours for non-patient visitors who must physically enter the practice to minimize exposures to and from patients.

Visit Workflows

Confirmation calls
Contact patients no more than 48 hours before scheduled telehealth or in-person appointment to conduct check-in process (confirm appointment, verify insurance, collect copayment/payment, demographic information).

Confirming in-person visits
- Orient patient to new office procedures
- Request patients to arrive wearing a clean mask
- Request that patients arrive alone, if possible, or minimize the number of people accompanying them. Offer speakerphone presence for family members or interpreters. If patient needs to be accompanied, request that companion wears a clean mask as well.
- Screen patients and necessary companions for COVID-19 symptoms:
  - Fever
  - Cough
  - Shortness of breath or difficulty breathing
  - Chills
  - Muscle aches
  - Sore throat
  - New loss of taste or smell
  - Vomiting or diarrhea

If any COVID-19 symptoms are present, clinician should triage (including whether the patient can/should be managed by telehealth). If an in-person visit is required, note the patient’s possible COVID-19 status on the schedule.
Office Space Reconfiguration and Workflows (continued)

Before in-person visits
- Distribute any paperwork electronically (or through US mail) for completion and submission prior to appointment as needed.

Patient Check-In, Rooming, and Check-Out Workflow
- Modify current workflows to minimize the amount of physical contact between staff and patients at check-in, rooming and check-out.

Patient Arrival/Office Flow
- Direct patients to wait in their cars or other areas before entering building for appointment
- Have staff member wearing a procedure mask greet patient at car or entrance.
  - Have small supply of procedure masks for patients and necessary companions not arriving with their own.
- Direct patient to an exam room upon arrival, without stopping in waiting room.
- Any check-in protocols not already completed in advance should be completed in exam room (e.g., collect co-pays). Use contactless means when possible.

After all visits
- Before referring patients for any follow-up services (including imaging, lab testing, ancillary therapy services, or regular clinical consultations) verify the facility is open, accepting patients, and providing the needed services.
- For frequently used services, it may be helpful to check with the preferred ancillary provider on a regular basis (e.g., weekly), until full service is restored.

After in-person visits
- Direct patients to remain in their exam rooms until a staff member instructs them to leave (to minimize the opportunity to encounter other patients in hallways or waiting area).
- Conduct check-out procedures (e.g., payments, scheduling follow-up appointments, etc.) in the exam room, over the phone, or online after the appointment.
Reassuring Staff, Patients, and Families

A series of messages and materials have been developed to help you communicate with staff, patients and families about the steps your practice is taking to deliver safe, quality care while COVID-19 remains prevalent.

The Safe with Us campaign has been initiated among all Wellforce member organizations, including NEQCA, MelroseWakefield Healthcare, Circle Health, and Tufts Medical Center. The campaign acknowledges concerns patients may have about going anywhere right now, including to a doctor’s office or hospital. It urges patients not to delay care and outlines the extensive safety measures you are taking to provide a clean, safe and supportive clinical environment.

MelroseWakefield Healthcare Safe with Us information includes:
- talking points for when talking with patients, family members and employees
- messages to patients
- website melrosewakefield.org\safewithus
- Safe with Us flyers and posters
- Safe with Us floor markers
- Safe with Us icon to use on communications

Other Resources

NEQCA’s COVID-19 website contains a wealth of information including:
- Mask Do's and Don'ts flier for display in your practices
- How to safely cover your face outside of the home video for posting to your website and social channels
- How to Correctly Put on/Take off a mask (adult and child videos)
- 10 Things You Can Do to Manage Yourself at Home
Massachusetts Department of Public Health Guidance
Reopen Approach for Health Care Providers
(Providers that are Not Acute Care Hospitals)

I. Preamble and Purpose

On March 15, due to the public health emergency arising from the outbreak of COVID-19, the Baker-Polito Administration ordered that, in order to protect patients and health care personnel and to conserve personal protective equipment (PPE), hospitals and ambulatory surgical centers postpone or cancel any nonessential, elective invasive procedures.¹ This Order is consistent with the recommendation of the Centers for Medicare & Medicaid Services (CMS) that all elective surgeries and non-essential medical, surgical, and dental procedures be delayed.²

While hospitals and health care providers have been providing care to COVID-19 patients and other patients requiring emergency care and have expanded use of telehealth, many healthcare services beyond elective invasive procedures have also been delayed and deferred during the public health emergency. There is a need to begin to provide certain deferred care to patients that cannot be provided remotely via telehealth, while also recognizing that telehealth may not be feasible or clinically appropriate for all patients. The Baker-Polito Administration has determined that such care can begin to be provided in Phase 1: Start of the Commonwealth’s reopening process, subject to guidance of the Department of Public Health (DPH).

DPH issues this guidance for how health care providers that are not acute care hospitals³ can begin in-person provision of a limited number of additional, necessary services and procedures without jeopardizing health system capacity or the public health standards that are essential to protecting health care workers, patients, families, and the general public. This guidance does not apply to emergency care, which has been ongoing and will continue without limitation. DPH recognizes the importance of ensuring that this guidance promote equitable access to care across all communities and patient populations, including low-income communities, children, and individuals with disabilities.

³ As used in this document, “health care provider” or “provider” means those providers that are not acute care hospitals. DPH has issued separate guidance for acute care hospitals. See Massachusetts Department of Public Health (DPH) Reopen Approach for Acute Care Hospitals guidance.
The initial and ongoing implementation of this guidance is contingent on Massachusetts meeting a range of relevant capacity and public health metrics. Ongoing performance on these measures will inform additional reopening decisions for future phases.

II. Statewide Capacity Criteria for Entering Phase 1: Start

Consistent with a cautious and deliberate reopening strategy, DPH has determined that health care providers will be eligible to enter Phase 1: Start as follows.

Beginning on May 18, 2020, community health centers (CHCs)\(^4\) that meet the Public Health and Safety Standards described in Section IV of this document will be eligible to move into Phase 1: Start if the following statewide capacity criteria are met.

1. **Intensive Care Unit (ICU) Bed Capacity:** The number of available, staffed adult ICU beds statewide must be at least 30% of total staffed adult ICU beds (including staffed surge ICU beds\(^5\)).\(^6\)

2. **Inpatient Bed Capacity:** The number of available, staffed adult inpatient beds (including adult ICU and adult medical/surgical beds) statewide must be at least 30% of total staffed adult inpatient beds (including staffed surge beds\(^5\)).\(^6\)

DPH will assess progress against the statewide capacity criteria based on the data reported daily by hospitals in WebEOC, using a seven-day average, and will announce when the statewide capacity criteria have been met on or after May 18, 2020. Prior to beginning in-person delivery of any Phase 1 procedure or service between May 18, 2020 and May 24, 2020, the CHC must complete and submit to DPH the Health Care Provider attestation form, and post the completed form on the CHC’s website, as detailed in Section V.

Beginning on May 25, 2020, health care providers (including CHCs that have not yet moved into Phase 1) that have met the Public Health and Safety Standards described in Section IV of this document will be eligible to move into Phase 1: Start if the statewide capacity criteria continue to be met. Prior to any health care provider beginning in-person delivery of any Phase 1 procedure or service in-person on or after May 25, 2020, the health care provider must complete the Health Care Provider attestation form, and post the completed form on the CHC’s website, as detailed in Section V.

---

\(^4\) For purposes of this guidance, the term “community health center” shall include Federally Qualified Health Centers and hospital-licensed community health centers.

\(^5\) For the purpose of this guidance, staffed surge beds (ICU or inpatient) means those beds that are currently staffed or that the hospital can staff within 12-24 hours. Unstaffed surge beds, i.e., those that can be made available within 72 hours, should not be included. See

\(^6\) To calculate bed availability at a statewide or hospital-system level, DPH will sum the available (open) beds and the total staffed beds across the state or hospital system, respectively, and then divide the total number of available (open) beds by the total number of staffed beds. To calculate a 7-day average, DPH will calculate the bed availability rate for the seven previous days and take an average of the seven rates.
attestation form, as detailed in Section V. The completed attestation form must be kept on file by the health care provider for inspection by DPH upon request.

DPH will continue to monitor statewide bed availability and may require that health care providers suspend or limit provision of any of the procedures and services described in Section III of this guidance based on its determination that statewide bed capacity is deemed to jeopardize the health system’s ability to respond to patient demand.

III. Guidance on Recommended Procedures and Services

Once the statewide capacity criteria have been met, in Phase 1: Start, health care providers that have met the public health and safety standards described in Section IV may begin in-person delivery of certain procedures and services that, based on the health care provider’s clinical judgment, constitute:

1. High-priority preventative services, including pediatric care and immunizations, that cannot be provided safely and appropriately via telehealth, recognizing that telehealth may not be feasible or clinically appropriate for all patients.

2. Urgent procedures and services that cannot be delivered remotely and would lead to high risk or significant worsening of the patient’s condition if deferred.

Health care providers should consider the following examples in making their determinations.
Examples of Services That Can be Delivered In-Person in Phase 1

Examples below are illustrative only and not comprehensive. Providers should use their clinical judgment in determining which services are appropriate for patients consistent with the criteria.

- Pediatric visits, high priority preventative visits that lead to high risk if deferred, e.g., immunizations, screenings for at-risk patients (such as colonoscopies for individuals with family history of cancer), or chronic disease management visits for high-risk patients
- Diagnostic procedures for high risk patients that lead to high risk if deferred, e.g., colonoscopy for blood in stool, biopsy for concerning lesions and potential cancers, urgent labs, tests, blood draws
- Exams for new concerning symptoms requiring physical exam, e.g., breast lump, post-menopausal vaginal bleeding, or individuals at high-risk of chronic diseases, such as poorly controlled diabetes
- Medical procedures that if deferred lead to substantial worsening of disease, e.g., excision of malignant skin lesions, orthopedic procedures for significant functional impairment
- In-person visits for high risk behavioral health and/or social factors, e.g., domestic violence, child abuse or neglect assault, substance use disorder treatment including Medication Assisted Treatment
- Dental procedures that are high risk if deferred, e.g., tooth extractions for abscess
- Rehabilitation for which delay would lead to significant worsening of condition and long-term prognosis, e.g., for post-stroke patients or severe traumatic injuries
- Placement of implantable contraception

As health care providers begin planning to provide deferred or delayed care, they should develop a strategy to identify the patients and services that, based on the clinical determination of the provider, are most urgent. Such strategy should incorporate considerations such as chronic illness, disability, or risk factors related to the social determinants of health, without regard for a patient’s insurance type.

Because of unique considerations for children, consistent with the requirements of this guidance, in Phase 1, health care providers may resume routine pediatric care, including in-person well child visits. Missed scheduled vaccines should be prioritized. Providers should continue screening for social needs, behavioral health concerns, child abuse, and intimate partner violence.

Health care providers should also continue to provide services via telehealth to the greatest extent possible when clinically appropriate, while also recognizing that telehealth may not be feasible or clinically appropriate for all patients. Examples of services that may be clinically appropriate for telehealth include: preventative care; wellness; chronic disease management; consultations; behavioral health treatment; and pre-appointment patient screenings.
If a health care provider is unable to utilize telehealth for a patient where telehealth is clinically appropriate and the patient would otherwise be able to be served by telehealth, the provider should consider referring the patient to another provider with telehealth capabilities when appropriate. All patients should be encouraged to call their provider or urgent care facility prior to making an in-person visit, except in an emergency.

IV. Required Public Health and Safety Standards

In order to provide the services outlined in Section III in Phase 1: Start, health care providers must meet specific criteria related to: a) personal protective equipment (PPE); b) workforce safety; c) patient safety; and d) infection control. Each health care provider must develop written policies and procedures that meet or exceed the requirements of this Section or incorporate the requirements of this Section into its existing policies and protocols. Health care providers must designate a compliance leader at the highest level of the organization to ensure compliance with the clinical and safety standards outlined in this guidance.

A. Personal Protective Equipment and Other Essential Supplies

Health care providers must continue to follow the most recent guidelines issued by DPH\(^7\) that align with the CDC as it relates to PPE usage, including any updated guidelines released subsequent to the date of this guidance. In addition, health care providers must meet the following three standards related to PPE supply.

1. Health care providers must ensure that they have adequate supply of PPE and other essential supplies for the expected number and type of procedures and services that will be performed. To meet this requirement, providers may not rely on additional distribution of PPE from government emergency stockpiles.

2. Health care providers must take reasonable steps to maintain a reliable supply chain to support continued operations.

3. Health care providers must develop and implement appropriate PPE use policies for all services and settings in accordance with DPH and CDC guidelines.

\(^7\) Please see: [https://www.mass.gov/info-details/covid-19-guidance-and-directives](https://www.mass.gov/info-details/covid-19-guidance-and-directives)
B. Workforce Safety

Health care providers must meet the following five standards related to workforce safety.

1. All staff must have appropriate PPE to perform the service or procedure and any related care for the patient. If appropriate PPE is not available to protect the health care workers involved in the patient’s care, the service/procedure should be cancelled.
   a. Health care providers and other staff must wear at least surgical facemasks at all times, consistent with DPH’s Comprehensive PPE Guidance.
   b. Eye protection (goggles, visor, or mask with visor) and N95 or equivalent respirator masks must be provided by the health care provider and worn by all health care workers while engaged in direct patient care for procedures with increased potential for droplet aerosolization.

2. Health care providers must restrict the number of health care workers in the treatment space to those individuals necessary to complete the service or procedure for the patient.

3. Health care providers must have a written protocol in place for screening all employees for symptoms of COVID-19 prior to entering the facility or office.

4. Health care providers must adopt policies that address health care worker safety and well-being.

5. The facility or office must ensure social distancing for providers and staff to the maximum extent possible (see Section IV.D).

C. Patient Safety

Health care providers must meet the following four standards related to patient safety.

1. Health care providers must have a process for screening patients and companions for symptoms of or known exposure to COVID-19 prior to entering the office/facility.

2. Health care providers must have policies and procedures for screening patients in advance of a service or procedure, including policies and procedures to facilitate the testing of patients for COVID-19 when medically appropriate as well as for determining whether a procedure should go forward if a patient tests positive.
3. Health care providers must develop policies permitting patient companions only in special circumstances when necessary for the patient’s well-being. Special circumstances and populations may include end-of-life care, prenatal care, pediatric patients, behavioral health patients, patients with intellectual or developmental disabilities, patients with physical disabilities, or populations as otherwise identified by DPH. Health care providers must also ensure that policies address patient visitors consistent with DPH guidance. These policies must be accessible to patients seeking care.

4. Health care providers must require that all patients, companions, and visitors wear mouth and nose coverings as consistent with DPH guidance. However, the health care provider may consider waiving the requirement for mask and nose coverings for patients and/or companions in special circumstances consistent with applicable guidance.

D. Infection Control

Health care providers must meet the following four standards related to infection control.

1. Health care providers must demonstrate adherence to social distancing and relevant guidelines from DPH and CDC regarding infection control and prevention to maintain a safe environment for patients and staff.

2. Health care providers must adopt administrative and environmental controls that facilitate social distancing, such as minimizing time in waiting areas, including by asking patients to wait outside until their appointment begins to the greatest extent possible. For any waiting patients, social distancing and face coverings must be in place.

3. Health care providers must minimize contact between patients through scheduling, such as establishing different times of day or separate space to avoid possible exposure to COVID-19.

4. Health care providers must have signage to emphasize public health measures (i.e., distancing, coughing etiquette, wearing of face coverings, and hand hygiene) and must provide access to hand sanitizer for patients and staff.

5. Health care providers must have an established plan for thorough cleaning and disinfection of all common and procedural areas, including in-between patient encounters in treatment rooms, which may require hiring environmental services staff and reducing patient hours to allow for more frequent cleaning.

---

V. Compliance and Reporting

Attestation Form
Health care providers seeking to deliver the services described in Section III must first attest, on a form prescribed by DPH, to meeting the public health and safety standards outlined in Section IV, to having designated a compliance leader at the highest level of the organization to ensure compliance with the clinical and safety standards outlined in this guidance, to making clinical determinations about service provision in a manner consistent with this guidance, and to making reasonable efforts to recall furloughed direct care workers to the extent possible. The attestation must be signed by the chief executive officer of the CHC and for other health care providers by the compliance leader responsible for internal compliance with these criteria. CHCs and other health care providers must maintain the signed attestation and make it available upon request of DPH at any time.

CHCs that seek to provide services consistent with this guidance prior to May 25 must additionally post the signed attestation prominently on their website with a link to the Commonwealth’s Reopening website, and submit their attestation to the state before they begin providing expanded service. The submission should be emailed to DPH.BHCSQ@MassMail.State.MA.US with the title “Phase 1 Attestation-Your CHC Name” and the attestation included as an attachment.

Written Policies and Protocols
Health care providers must maintain written policies and protocols that incorporate or exceed the standards outlined in this guidance for PPE and supplies, workforce safety, patient safety, and infection control. Such policies, protocols, and documentation must be regularly updated and made available to DPH upon request at any time.

Compliance
DPH will monitor and assess compliance and may require remedial action or suspension of Phase 1: Start procedures and services as warranted.
Massachusetts Department of Public Health
Health Care Provider Phase 1 Reopen Attestation

This self-attestation form is applicable to all health care providers other than acute care hospitals and must be completed prior to performing Phase 1 services and procedures as defined in Massachusetts Department of Public Health (DPH) Reopen Approach for Health Care Providers (Providers that are Not Acute Care Hospitals) guidance (“DPH Provider Reopening Guidance”). The form must be signed by the provider’s designated compliance leader or, in the case of a community health center (CHC) as defined in DPH Provider Reopening Guidance, the CHC’s chief executive officer.

CHCs that meet the criteria below and intend to perform Phase 1 services and procedures prior to May 25, 2020 must prominently post the completed attestation to the CHC’s website with a link to the Commonwealth’s Reopening website and submit the form to DPH at DPH.BHCSQ@massmail.state.ma.us. The attestation should be included as an attachment to the email and the subject of the email should be “Phase 1 Attestation – Your CHC Name.”

A health care provider that meets the criteria below and intends to perform Phase 1 services and procedures on or after May 25, 2020 must retain this attestation for inspection upon request by DPH.

APPENDIX B
A. **PPE and essential supplies**

1. Inventory levels are checked daily. Inflow from suppliers and usage are noted daily, of PPE, disinfectants and other necessary supplies

2. A list of alternate suppliers is maintained in case of shortage
   
   a. The Mass. DPH may not be considered as an alternate supplier for this purpose

3. PPE policies have been developed and implemented. Existing employees have been trained, and new employees will be trained, in accordance with these policies (See below)

B. **Workforce Safety**

1. If PPE inventory is insufficient for a care encounter, that encounter is not begun.

   a. Simple facemasks (“surgical”, “procedure”) must always be worn by staff providing patient care

   b. Aerosol-generating procedures create increased risk of infection. They should be avoided whenever possible. These procedures will not be performed routinely. If there should be a pressing need requiring such a procedure (e.g. a nebulizer treatment when inhaled treatment with a metered-dose inhaler is not possible or clinically appropriate), it will only be performed if any health care personnel in the room are wearing eye protection and N95 masks for which the personnel have been fit-tested and instructed in proper use.

2. The number of health care personnel within a room while care is being rendered should be the minimum needed for that care in order to reduce potential exposures to COVID-19 and other infections.

3. Providers and staff are required every day before they arrive at the office to attest that they have no symptoms suggestive of COVID-19 (Fever, chills, cough, shortness of breath or difficulty breathing, sore throat, muscle aches, vomiting or diarrhea, new loss of taste or smell). This attestation must be recorded in writing or in an electronic storage medium.
Policies and Procedures for <practice name> for providing care in the COVID-19 era (continued)

B. Workforce Safety (continued)

4. Practice leaders must attend to the emotional wellbeing of all providers and staff. Information, education and reassurance regarding measures to ensure safety must be given to all office personnel. Should anyone in the office display signs of emotional distress, that staff member should be offered a referral for support to an appropriate behavioral health provider.

5. Staff must endeavor to stay at least six feet apart consistently. If at any time this is not possible, all staff <6 feet from one another must be masked. (The workspace should be configured to permit that distancing if possible.)

C. Patient Safety

1. Patients and necessary companions are screened for COVID-19 symptoms (Fever, chills, cough, shortness of breath or difficulty breathing, sore throat, muscle aches, vomiting or diarrhea, new loss of taste or smell) before the visit. Should any of these be present, a clinician should triage this visit before the patient enters the office.

2. Intentionally omitted (not applicable).

3. Patients are told to arrive alone, if possible, or minimize the number of people accompanying them.

4. Patients and necessary companions must wear a mask before entering the office. If they do not have a mask, they must be met outside the office by a masked staff member who brings masks for both patient and companion.
Policies and Procedures for <practice name> for providing care in the COVID-19 era (continued)

D. Infection Control

1. Patient flow should be reconfigured to avoid patient-patient encounters.

2. Patients are brought into the office by a staff member who knows where other patients are and thus can avoid them. Patients are cared for throughout the encounter in one exam room. Patients are not to leave the exam room without clearance from a staff member who can check the corridor to make sure no other patients are there. The waiting room must be reconfigured to create >6 foot distances between seats, with other seats removed, blocked or labeled NOT FOR USE. All patients are requested to wear a mask or one may be provided by a staff member meeting them outside the office. Additional masks are made available in the waiting area.

3. Schedules are staggered to avoid patients arriving and leaving at the same time. In addition, staff check corridors to make sure a patient leaving an exam room has a clear path to the exit without encountering other patients. One daily session is dedicated to patients without clinical suggestion of COVID-19 disease; another is dedicated to patients who have suspected or confirmed COVID-19 infection.

4. Signs are posted in the waiting room and outside the entrance: “All patients and visitors must be masked. If you need a mask, ask any of our staff.” Within common areas: “Cover your cough”; “Please maintain a distance of more than 6 feet from all other patients and staff”; “Clean your hands frequently with soap and water or with hand sanitizer.” Signs should also indicate the location of Infection Control Stations containing masks, sanitizer and tissues.

5. Cleaning and disinfection: Visible soiling is always cleaned up before disinfection. A disinfectant approved by the EPA for use against SARS-CoV-2 is used at an appropriate dilution via spray or wipe, and left in contact with the surface for the necessary contact time per manufacturer’s instructions. High-touch surfaces in the exam room or in any procedure room are disinfected after every patient. These include the exam table, chair, doorknobs, light switch, faucets, and anything else the patient likely touched during the visit. These surfaces are also cleaned with a standard surface cleaner whenever visibly soiled and at the end of the day, along with other high-touch surfaces like touch screens and keyboards. High touch surfaces in waiting rooms, staff areas, and any common areas are disinfected twice a day. Floors are cleaned at the end of every day with usual cleansing agents. Computer keyboards are covered with a plastic overlay so they can be easily disinfected.
**DON**
Gown - Mask - Faceshield - Gloves

**HAND HYGIENE**

1. Tie both neck and waist straps
2. Form mask to face
3. Put shield on face shield and tighten straps
4. Put on gloves and cover cuff of gown

**DOFF**
Gloves - Faceshield - Gown - Mask

**HAND HYGIENE**

1. Remove gloves by turning inside-out
2. Take off face shield by pulling on ear straps
3. Untie neck and waist straps, bend forward, remove gown and turn inside out
4. Remove N95 by the straps, DO NOT touch front of mask

Please visit NEQCA.org for additional resources.
Aerosal-Generating Procedures  
Adapted from Tufts Medical Center, May 11, 2020

Examples:

- Intubation, extubation and related procedures such as manual ventilation and open suctioning
- Tracheotomy/tracheostomy procedures (insertion/open suctioning/removal)
- Bronchoscopy
- Surgery and post-mortem procedures involving high-speed devices
- Non-invasive ventilation (NIV) such as bi-level positive airway pressure (BiPAP) and continuous positive airway pressure ventilation (CPAP)
- High-frequency oscillating ventilation (HFOV)
- High-flow nasal oxygen (HFNO), also called high-flow nasal cannula

These are the only procedures that would typically be done in an office setting:

- Induction of sputum
- Medication administration via continuous nebulizer (Metered dose inhaler use is an appropriate alternative that avoids aerosol generation)
- Some dental procedures (such as high-speed drilling)
Extended Use of Surgical Masks

Adapted from Tufts Medical Center, May 11, 2020

This guideline is for surgical mask usage in times of pandemic with supply shortage and is designed to safely increase the availability of face protection.

Extended Use -- The practice of wearing the same surgical mask for repeated close encounters with several patients without removing between patients.

- Wear surgical masks for repeated patient encounters (regardless of COVID-19 status). It is safe to wear the same surgical mask and eye protection with COVID-19 positive and COVID-19 negative patients provided you perform hand hygiene in between and do not touch the surgical mask or eye protection.
- If a patient’s hands inadvertently touch eye protection or surgical mask that has been used in another patient's care, assist patient with performing hand hygiene.
- When practicing extended use of surgical masks, if inadvertently touched, perform hand hygiene.
- If you need to adjust the fit of the surgical mask without donning it, perform hand hygiene before and after. If possible, don gloves to touch surgical mask.
- Once surgical mask is donned, keep it on for as long as possible, provided the conditions below which require mask change have not been met.
- Extended use of surgical mask is for up to 8 hours only.
- Surgical mask should be doffed and a new one donned if:
  - Wet, torn or soiled
  - Taking a break, eating or drinking

Reminders:
While extended use of surgical masks and eye protection is allowed, gowns and gloves must still be changed between patients

Tutorial Video (courtesy of Tufts Medical Center)
- Extended use of surgical masks
Extended Use of Eye Protection

Adapted from Tufts Medical Center, May 11, 2020

This guideline is for eye protection usage in times of pandemic with supply shortage and is designed to safely increase the availability of face protection.

**Extended Use** -- The practice of wearing the same eye protection for repeated close encounters with several patients without removing or reprocessing between patients.

- Wear eye protection for repeated patient encounters (regardless of COVID-19 status). It is safe to wear the same eye protection with COVID-19 positive and COVID-19 negative patients, provided you perform hand hygiene in between and do not touch the eye protection.
- If a patient’s hands inadvertently touch eye protection that has been used in another patient's care, assist patient with performing hand hygiene.
- There is **NO** Reuse of eye-wear during a session - only Extended Use as described above.
- When practicing extended use of eye protection, if inadvertently touched, perform hand hygiene.
- If you need to adjust the fit of the eye protection without doffing it, perform hand hygiene before and after. If possible, don gloves to touch used eye protection.
- Once eye protection is donned, keep it on for as many patient encounters as possible.
- Extended use of eye protection is for one session only. At the end of the shift, dispose in trash OR drop into designated container for cleaning and disinfection as appropriate.
- Eye protection *can* be left on in common areas.
- It should be doffed (per below) and discarded in a reprocessing bin before eating or drinking, or if a break is needed.

**Reminders:**
While extended use of eye protection is allowed, gowns and gloves must still be changed between patients.

Appendix D
Message Points for when Talking with Patients and Families  (5.27.20)

As we take measured steps to safely lift restrictions on procedures and services following the recent COVID-19 surge, we know that patients have questions and concerns about receiving care, especially in our hospitals and clinics, while COVID-19 is still in the community.

Below are some suggested talking points to help support discussions with patients and families about receiving care at our hospitals and practices.

These messages are consistent with messages that will be promoted as part of a MelroseWakefield Healthcare/Tufts Medical Center Community Care “Safe with Us” campaign. They are also consistent with message points recently shared by the Massachusetts Health and Hospital Association.

It may be helpful when talking with patients to ask outright: What questions or concerns do you have about this appointment/procedure or coming to the hospital/clinic? That way no question/concern goes unanswered. It is hoped that the information below will help adequately address the most common concerns.

Please note: Response to COVID-19 remains fluid, and there could be updates to guidelines and procedures at any time. Our responses are always guided by directives from CDC, state DPH and our infectious disease providers with a continuous focus on safety.

For concerns about coming to the hospital: Safety is always the priority

- Hospitals are – and will continue to be -- highly regulated environments and are safe places to receive care.
- Hospitals safely manage infectious diseases every day. Long before COVID-19, we had processes in place to help keep everyone in a hospital setting safe from the risk of infection.
- A number of extra safety precautions have been put in place for the safety of everyone – patients and staff alike -- at both our hospitals and outpatient clinics.
- When you arrive at the hospital you can expect:
  - Universal masking of all employees, staff and patients.
  - Daily screening for symptoms of all patients and employees. Employees attest daily to having any symptoms.
  - Universal swab testing for COVID-19 of all patients before hospital procedures or upon admission.
  - Separate care areas in the emergency department and separate inpatient isolation units for the care of COVID-19 patients.
  - Continued limitation of visitors and guests.
  - Promotion of social distancing and hand washing/cleaning.
A note about antibody testing: Antibody testing is available and occurring at Tufts Medical Center. We are not currently offering it as the science is still not clear on what the presence of an antibody means and we are not able to tell if it is the result of the new COVID-19 virus or another related coronavirus infection.

Appropriate PPE at the hospital

- There has been much in the news about low supplies of PPE (masks and other personal protection equipment). There has been a tremendous amount of work done by hospital administrators and care providers at the hospitals to safely conserve PPE for the protection of patients and employees.
- We are performing the procedure/appointment/surgery with all the required appropriate PPE. We would not do so if we could not do it safely with the appropriate protections.

Testing of patients for COVID-19 prior to hospital procedure

- Patients coming into the hospital for procedures are tested for COVID-19 48-72 hours prior to the procedure.
- Patients will be contacted by The Central Scheduling department at MelroseWakefield Hospital to schedule their COVID-19 test.
- COVID-19 testing is done at Lawrence Memorial Hospital Urgent Care entrance (Lawrence Rd).
- For the convenience and safety of patients, patients are given a date and time to arrive for the test. Patients pull up to Lawrence Memorial Hospital Urgent Care parking lot at the designated time. Patients do not have to get out of the car for testing. An employee will come to the car, confirm patient and appointment, and swab for the COVID-19 test.

The hospitals continue to limit visitors and guests

For the continued safety of patients, visitors and guests are restricted. Anyone accompanying you to your procedure may not be permitted to come with you into the hospital; however the staff will work with you to coordinate communication with your family member or friend.

If being admitted, staff will work with you to be in contact with your family member or friend.

Don’t Delay Care with Your Primary Care Provider or Specialist; or Emergencies

- The safety and well-being of our patients during this outbreak is our top priority.
• We are concerned to hear that many patients are delaying care that they need, be it emergency or urgent care, or care for more chronic conditions.

• A number of measures have been taken to care for patients safely who have health care needs not related to COVID-19.

• This is especially true for patients with chronic and acute conditions, pregnant women who need prenatal care, and children and infants including those who need their primary vaccinations.

• If you have been delaying your care due to fears about COVID-19, please talk to me (or talk to your physician’s office) about your concerns. We are available to speak with you by phone or by telemedicine visits to get you the care that you need.

• In addition, if it is determined that you should be seen in person, our staff will guide you through the steps we take to ensure your safety.

• Separate care areas have been established in the hospital’s emergency department to care for COVID-19 patients.

Availability of Telemedicine with Physician Practices

Very early on, we introduced telemedicine capabilities, and will continue to offer it as we move forward.

• It’s been an added convenience for patients and if you would like to learn more about it, my office is happy to work with you.

• If it is determined that you need to come into the office, we continue to provide care safely by wearing masks and promoting social distancing. Specifically in our office (if pertinent to you/your office/practice) we are doing the following:
  o Daily screening of employees for symptoms.
  o Prior to appointments, we pre-screen patients for symptoms and also pre-registration, take co-pays, and other visit needs by phone.
  o Thorough cleaning and sanitizing of exposed surfaces between visits and nightly.
  o Staggered appointments to maximize social distancing.

Ultimately, if the patient is unsure about coming into the hospital or other health care environment

I want to assure that it is a safe and clean/sanitized environment. If it was not, we would not be asking you to come.
